
a
Spontaneous bursts per min
Minimal correction
Literature-consistent
Cell-type vote
No fast monoamines
Calibrated model
Synaptic gain (× calibrated)
b
FlyWire whole-brain model, noise + short-term depression, gain 2.5 (minimal correction)
Spikes per ms
Virtual MEA: 1,024 random neurons (sorted by x)
Time (s)
c
Where bursts start (frontal view; grey, not enriched)
Excess spikes per neuron, 20 ms before onset (log10)

29 bursts; groups crossing in ≥ 50% of bursts
Threshold crossing relative to brain-wide burst onset (ms)
